**ABSTRACT**

Agriculture has strong relation with environmental issue which may be subject to vulnerability. Climate risk plays major role to influence sustainability of agriculture. However, climate change as one of important reason to some harvesting failure has been believed anthropogenic factor dominating its occurrence. Since human has become main factor of its change, adaptation to answer challenge of agriculture and environment is supposed to turn back belonging to human.

Unfortunately, responsibility of agricultural and environmental importance is still lack. Even decreasing interest of those sectors also happens. Thus, to encourage youth and children as the next agent of change has become important. Through informal agriculture and environment education method with some attractive ways is hoped to build passion to raise motivation concerning on agricultural sector, even environmental sector as well. Considered environmental change hugely influences agricultural sector, to combine both of them is appropriately needed to build stronger base in order answering future challenge.
